In nearly all control applications, the output signal of the compensator cannot be transferred to the system with unlimited amplitudes and arbitrarily fast.

For these reasons, the study of the control problem (its structure, performance and stability analysis) for systems subject to both amplitude and rate actuator or sensor saturations as typical constraints has received the attention of many researchers in the last years.

The control problems of combat aircraft prototypes and satellite launchers offer interesting examples of the difficulties due to these major constraints. Neglecting actuator saturations on both amplitude and dynamics can

be source of undesirable or even catastrophic behavior for the closed-loop system (such as losing closed-loop stability).

where  $x \in \mathbb{R}^n$  is the system state,  $u \in \mathbb{R}^m$  is the control input,  $y \in \mathbb{R}^p$  is the measurement output,  $z \in \mathbb{R}^p$  is the controlled output,  $d \in \mathbb{R}^q$  is the external disturbance, with  $\|d\| \leq \delta$ , for some  $\delta > 0$ . The function  $\sigma(u, t)$  is a saturation type function that represents the actuator input-output characteristics and is not precisely known. The function  $\sigma(u, t)$  is however assumed
