A numerical estimate of critical exponents permits one to insert the transition in a proper universality class, within percolation phenomena. Nonlinear dynamics and instabilities in systems with many degrees of freedom have been recently studied both in spatially extended [1] and in delayed systems [2]. In the former case, insight into complex behaviour has been gained by the extensive Equilibrium of two liquid phases and critical phenomena in ...

The hypothesis of isomorphism of critical phenomena allows one to generalize the concept of universality, formulated at first for one-component fluids, to binary and multicomponent mixtures [3, 4].
