[Inverse limit - Wikipedia](#)

Inverse limits in the category of topological spaces are given by placing the initial topology on the underlying set-theoretic inverse limit. This is known as the limit topology. The set of infinite strings is the inverse limit of the set of finite strings, and is thus endowed with the limit topology.

In (relatively) simple words: What is an inverse limit?

In the inverse limits, you are "zooming in" and looking at smaller and smaller views; you already have that the different views are consistent on the overlaps; there are details that you can only see once you are "sufficiently close", and the inverse limit is a way of keeping track of all the details you can see at different resolutions.

 Abstract The Gelfand - Naimark theorem supplies the one to one correspondence between commutative  $C^*$ -algebras and locally compact Hausdorff spaces. So any noncommutative  $C^*$ -algebra can be regarded as a generalization of a topological space.

The inverse cosine function is defined quite similarly to the inverse sine function. The domain of the cosine function is restricted to  $[0, \pi]$ , so that it becomes a one-to-one function. The definition of the arccosine function is shown below.

In mathematics, the inverse trigonometric functions (occasionally also called arcus functions, antitrigonometric functions or cyclometric functions) are the inverse functions of the trigonometric functions (with suitably restricted domains). Specifically, they are
