The migration of fine particles in porous media is an  
engineering concern in oil production, soil erosion, ground  
water pollution and in the operation of filter beds. As a  
result, the topic has been studied by researchers working in  
a number of disciplines. These studies in different  
disciplines are conducted, by and large, independently and  
hence there is some repetition and perhaps more

A model is applied to the processes of fines migration and  
fines injection in a porous medium. The first is a problem  
frequently encountered in oil reservoirs when release of  
fines is triggered by physicochemical interactions of the  
porous formation with the injected fluids. The second may

In Comsol 4.0a, when using - Species transport in porous  
media - Darcy's Law Comsol solves for all the  
concentrations, i.e. all species are dependent variables  
(instead of N-1 species when using Transport of  
concentrated species for example).
