In relativistic mechanics, the time-varying mass moment  $\mathbf{L}$  and orbital 3-angular momentum  $\mathbf{L}$  of a point-like particle are combined into a four-dimensional bivector in terms of the 4-position  $\mathbf{X}$  and the 4-momentum  $\mathbf{P}$  of the particle:  $\mathbf{L} = \mathbf{X} \wedge \mathbf{P}$  where  $\wedge$  denotes the exterior product.

The idea of relativistic time is a direct result of Albert Einstein's Theory of Relativity. Since Albert Einstein published his Theory of Relativity (the Special Theory in 1905, and the General Theory in 1916), our understanding of time has changed dramatically, and the traditional Newtonian idea of absolute time and space has been superseded.

In classical mechanics, mass of a particle is considered to be a constant quantity and independent of its velocity.

However in relativistic mechanics the length, time and mass also depends on the relative velocity. Suppose two similar balls B1 and B2 we have, velocity ( $u'$  and  $-u'$ ) and masses of its are similar in  $S'$  frame. These two balls

Relativistic mechanics: Relativistic mechanics, science concerned with the motion of bodies whose relative velocities approach the speed of light  $c$ , or whose kinetic energies are comparable with the product of their masses  $m$  and the square of the velocity of light, or  $mc^2$ . Such bodies are said to be relativistic, and when
